SKILLS

- React & Next.js
- Node.js / Express
- TypeScript / JavaScript
- PostgreSQL / MongoDB
- REST API Integration
- n8n / Python Automation
- Docker / CI/CD
- Git & GitHub

EDUCATION

BS Computer Science
COMSATS University Islamabad
2022 – 2026

CERTIFICATIONS

PostgreSQL for Everybody Specialization — University of Michigan

Meta Front-End Developer Specialization — Meta

Introduction to Next.js — Coursera

HTML, CSS & JavaScript for Web Developers — Johns Hopkins University

LANGUAGES

English
Urdu

INTERESTS

Coding & Problem Solving
Local-First Architecture
Automation & Tooling

SYED HAMZA

Full Stack Engineer

SUMMARY

Full Stack Engineer with experience across modern and enterprise stacks: React, TypeScript, Node.js, Express, and PostgreSQL. Currently building frontend features and API integrations for a large-scale ERP platform, alongside personal work in local-first architecture (TanStack DB, ElectricSQL) and business process automation (n8n, Python). Comfortable owning features end-to-end, from UI to data integration, and adaptable across client and product engineering contexts.

EXPERIENCE

Full Stack Engineer | SANWA Systems

Feb 2026 – Present • Islamabad, Pakistan (On-site)

- Work across the stack on an enterprise ERP platform for the US auto parts industry, building the React, TypeScript, and Tailwind CSS frontend and integrating it with PostgreSQL-backed APIs
- Built and maintained core frontend modules across Sales, Purchase, Import/Export, Inventory, Accounts, and Stakeholder Management, including invoicing, order management, financial reporting, and role-based access control
- Developed the platform's Accounts module, covering Chart of Accounts, General Ledger, Trial Balance, Financial Statements, and Bank Reconciliation
- Developed Excel import/integration features enabling bulk data workflows directly within the platform
- Handled API integration and data handling across multiple modules, ensuring accurate data flow between frontend and backend systems

Software Engineer | Vulto (Self-employed)

Feb 2026 – Present • Remote

- Building Vulto Planner, an industry-grade, local-first daily productivity application designed to eliminate loading states and network latency common in cloud-first tools
- Architected the app around TanStack DB for sub-millisecond, client-side reads and writes
- Integrated ElectricSQL for resilient offline synchronization, managing active-active replication to PostgreSQL with automatic conflict resolution via CRDTs
- Implemented query-driven shape replication to selectively sync active user data and maintain performance over long-term use

Software Engineer | Archwares

Jan 2025 – Present • Remote (Part-time)

- Work on a variety of client projects across web development, automation, and infrastructure, taking on whatever technology best fits each engagement
- Built end-to-end automation systems for business workflows, including a fully automated email deliverability audit pipeline (Fillout Forms, n8n, Notion, custom Python backend), replacing manual, error-prone processes with scalable, hands-off systems
- Delivered custom web platforms for clients across different stacks, including WordPress (custom booking engines, dynamic content modules, community forums) and Shopify
- Handled full project ownership on client engagements, from technical architecture and development to performance optimization and deployment

Frontend Web Developer (Intern) | YoungDev Intern

Jun 2024 – Jul 2024 • Remote

- Built responsive, user-friendly web applications using React.js and modern web technologies as part of a distributed team
- Collaborated with a remote team following agile practices to deliver features on schedule

SELECTED PROJECTS

EduExtract — AI-Powered Educational Content Platform

- Final year project built on the MERN stack (MongoDB, Express, React, Node.js): an AI-driven platform converting unstructured video content into structured learning resources
- Built features for automated transcription, topic-wise summarization, and auto-generated quizzes, flashcards, and presentation slides
- Designed a centralized content library with tagging, search, and role-based collaboration

Automated Email Deliverability Audit System

- End-to-end automation pipeline (Fillout Forms → n8n → Notion → Python backend) replacing a manual, multi-platform audit workflow
- Reduced hours of manual, repetitive checking to a fully automated, client-ready reporting system

CORE COMPETENCIES

- End-to-end feature ownership, from UI design through API integration to data handling
- Comfortable working across both modern product stacks (React, Node.js, Express) and large enterprise ERP systems
- Strong grounding in relational data modeling, gained through hands-on enterprise ERP and accounting-logic work and formal PostgreSQL coursework
- Adaptable across client-facing contract work and long-term product engineering
